

✓ Specialized accessories and innovative options

For aging-in place applications, Senior and assisted Living facility owners often require all rooms to be fully adaptable, meaning that all showers require barrier free or also called zero clearance entry thresholds, however not all occupants require zero clearance.

Semi-permanent dams provide a great alternative for this application. Three inches or less in height, these dams provide a low step entry into the shower allowing not only excellent water spillage protection but most importantly facility adaptability.

The dams are installed at jobs end using 100 percent flexible silicone adhesive and can be removed, cleaned, and reused if need be, all in less than 30 minutes by the maintenance staff.

Originally requested by a Long Island NY assisted living provider, semi-permanent dams have been a reliable choice of facilities in the US and Canada since 1996 including national provider Sunrise Assisted Living.
